Ground Truth

"Microscopic observation of the pathology slide reveals infiltrating lobular carcinoma cells with a pleomorphic and classical subtype, demonstrating **minimal formation of glandular structures, significantly deviating from normal tissue architecture with a tubule formation score of 3. The nuclei exhibit marked variability in size and shape, corresponding to a nuclear grade of 3. There is a moderate rate of cell division observed, reflected in a mitotic activity score of 2.** Areas of lobular carcinoma in situ are noted, comprising less than 5% of the total tumor volume and displaying association with the invasive carcinoma. **Notably, no definitive lymphovascular invasion is identified. Based on these observations, the diagnosis is invasive lobular carcinoma**, nuclear grade 3, **with a Nottingham score of 8/9 (3+3+2)**."

Pathologist Supervision

Diagnosis	Invasive Lobular Carcinoma
Grade	Grade 3
Nuclear Pleomorphism	High
Mitotic Activity	Moderate
Tubular Formation	Low
LVI	Absent

MiGen

"Microscopic observation of the pathology slide reveals epithelial cells infiltrating the surrounding stroma with **minimal formation of glandular structures significantly deviating from normal tissue architecture corresponding to a tubule formation score of 3. The nuclei exhibit moderate variability in size and shape earning a nuclear pleomorphism score of 2** and **there is a low rate of cell division observed corresponding to a mitotic count score of 1**. Ductal carcinoma in situ demonstrate intermediate nuclear grade with solid type is observed tubule formation. **Based on these observations the diagnosis is invasive ductal carcinoma nottingham grade 2 nhg2 with a total score of 6 out of 9**."
